Grapples for Forklifts

Grapple for Forklift - Grapples work in conjunction with the crowning operation of the bucket cylinder positioned on the excavator. They can mount directly onto the jib or any quick hitch which is in bucket position. Grapples are usually meant for the handling and processing of construction materials, timber, domestic and aggregate waste items. The grapple's boxed design has additional support bridging. This particular manufactured design provides the grapple with maximum strength and support by preventing the body from breaking and rotating throughout its function.

The grapple along with all of its moving parts are constructed of hardened steel. The pivot points are designed in order to ensure supreme closing force and holding ability. The operator has the capacity to handle different sizes and varieties of supplies using the jaws fitted at the end of the grapple with toes. This could enable the jaws to close through one another in a finger configuration for utmost handling capacity.
